Common Data for Questions 48 and 49:

48. The following code segment is executed on a processor which allows only register operands in its
instructions. Each instruction can have atmost two source operands and one destination operand. Assume
that all variables are dead after this code segment.

```
c = a + b;
d = c * a;
e = c + a;
x = c * c;
if (x > a) {
y = a * a;
}
else {
d = d * d;
e = e * e;
}
```

49. What is the minimum number of registers needed in the instruction set architecture of the processor
to compile this code segment without any spill to memory? Do not apply any optimization other
than optimizing register allocation.

(A) 3
(B) 4
(C) 5
(D) 6

[Ans. NF]

Common Data for Questions 50 and 51:

The procedure given below is required to find and replace certain characters inside an input character string supplied in array A. The characters to be replaced are supplied in array oldc, while their respective replacement characters are supplied in array newc. Array A has a fixed length of five characters, while arrays oldc and newc contain three characters each. However, the procedure is flawed.

```
void find_and_replace (char *A, char *oldc, char *newc) {
for (int i=0; i<5; i++)
for (int j=0; j<3; j++)
if (A[i] == oldc[j]) A[i] = newc[j];
}
```

The procedure is tested with the following four test cases.

(1) oldc = "abc", newc = "dab" (2) oldc = "cde", newc = "bcd"
(3) oldc = "bca", newc = "cda" (4) oldc = "abc", newc = "bac"

50. The tester now tests the program on all input strings of length five consisting of characters 'a', 'b', 'c', 'd' and 'e' with duplicates allowed. If the tester carries out this testing with the four test cases given above, how many test cases will be able to capture the flaw?
(A) Only one
(B) (B) Only two
(C) (C) Only three
(D) (D) All four

51. If array A is made to hold the string "abcde", which of the above four test cases will be successful
in exposing the flaw in this procedure?
(A) None
(B) 2 only
(C) 3 and 4 only
(D) 4 only
[Ans. NF]

Statement for Linked Answer Questions 52 and 53:
A computer uses 46-bit virtual address, 32-bit physical address, and a three-level paged page table
organization. The page table base register stores the base address of the first-level table (*T1*), which
occupies exactly one page. Each entry of *T1* stores the base address of a page of the second-level table (*T2*).
Each entry of *T2* stores the base address of a page of the third-level table (*T3*). Each entry of *T3* stores a page
table entry (PTE). The PTE is 32 bits in size. The processor used in the computer has a 1 MB 16-way set
associative virtually indexed physically tagged cache. The cache block size is 64 bytes.

52. What is the size of a page in KB in this computer?
(A) 2
(B) 4
(C) 8
(D) 16

53. What is the minimum number of page colours needed to guarantee that no two synonyms map to
different sets in the processor cache of this computer?
(A) 2
(B) 4
(C) 8
(D) 16
[Ans. NF]

Time and again the spider failed but that did not deter it to refrain from making attempts. Such attempts by the spider made Bruce curious. Thus, Bruce started observing the near – impossible goal of the spider to have the net. Ultimately, the spider succeeded in having its net despite several failures. Such act of the spider encouraged Bruce not to commit suicide. And then, Bruce went back again and won many battle, and the rest is history.
