Syllabus for Geotechnical Engineering

Soil Mechanics: Origin of Soils, Soil Structure and Fabric; Three-Phase System and Phase Relationships, index Properties; Unified and Indian Standard Soil Classification System; Permeability-One Dimensional Flow, Darcy's Law; Seepage Through Soils-Two-Dimensional Flow, Flow Nets, Uplift Pressure, Piping; Principle of Effective Stress, Capillarity, Seepage Force and Quicksand Condition; Compaction in Laboratory and Field Conditions; One-Dimensional Consolidation, Time Rate of Consolidation; Mohr's Circle, Stress Paths, Effective and Total Shear Strength Parameters, Characteristics of Clays and Sand.

Foundation Engineering: Sub-Surface Investigations - Scope, Drilling Bore Holes, Sampling, Plate Load Test, Standard Penetration and Cone Penetration Tests; Earth Pressure Theories -Rankine and Coulomb; Stability of Slopes-Finite and Infinite Slopes, Method of Slices and Bishop's Method; Stress Distribution in Soils-Boussinesq's and Westergaard's Theories, Pressure Bulbs; Shallow Foundations-Terzaghi's and Meyerhoff's Bearing Capacity Theories, Effect of Water Table; Combined Footing and Raft Foundation; Contact Pressure; Settlement Analysis in Sands and Clays; Deep Foundations-Types of Piles, Dynamic and Static Formulae, Load Capacity of Piles in Sands and Clays, Pile Load Test, Negative Skin Friction.

Analysis of GATE Papers

Year	Percentage of Marks	Overall Percentage
2015	15.00	15.68%
2014	12.00	
2013	15.00	
2012	14.00	
2011	18.82	
2010	20.00	
2009	16.00

2007	15.33	
2006	14.00	

Contents

Chapters	Page No.
#1. Introduction to Soil Mechanics	1 – 11
• Origin of Soil	1
• Three Phase System	1 – 4
• Pycnometer Method	5
• Solved Examples	6 – 8
• Assignment	9 – 10
• Answer Keys & Explanations	10 – 11
#2. Index Properties and Soil Classification	12 – 26
• Water Content	12
• Determination of Specific Gravity of Soil Solids	13 – 14
• Particle Size Distribution	14 – 15
• Particle Size Distribution Curve	15 – 19
• Indian Standard Soil Classification System	19 – 21
• Solved Examples	22 – 23
• Assignment	24 – 25
• Answer Keys & Explanations	26
#3. Permeability and Seepage	27 – 45
• Permeability	27
• Discharge Velocity and Seepage Velocity	28 – 33
• Uses of Flow Nets	34 – 37
• Flow through Non-Homogeneous Sections	37
• Prevention of Erosion- Protective Filters	37 – 38
• Stress Conditions in Soil: Effective and Neutral Pressures	38 – 40
• Solved Examples	40 – 42
• Assignment	43 – 44
• Answer Keys & Explanations	45
#4. Compressibility and Consolidation	46 – 60
• Introduction	46 – 48
• Calculation of Consolidation Settlement	48 – 49
• Normally Consolidated and Over-Consolidated Clays	49 – 52
• Determination of Co-efficient of Consolidation	52 – 53
• Logarithm of Time Fitting Method	53 – 54

• Solved Examples	54 – 57
• Assignment	58 – 59
• Answer Keys & Explanations	60
#5. Compaction	61 – 69
• Introduction	61
• Laboratory Tests for Compaction	61 – 62
• Zero Air Voids Line	62 – 63
• Factors Affecting Compaction	63 – 65
• Effect of Compaction	65 – 66
• Solved Examples	66 – 67
• Assignment	68
• Answer Keys & Explanations	69
#6. Stress Analysis	70 – 79
• Concentrated Force: Boussinesq Equations	70 – 72
• Stress Isobar or Pressure Bulb	72 – 75
• Westergaard's Analysis	75
• Contact Pressure	75 – 76
• Solved Examples	76 – 77
• Assignment	78 – 79
• Answer Keys & Explanations	79
#7. Shear Strength	80 – 100
• Introduction	80
• Mohr's Stress Circle	80 – 81
• Mohr's Coulomb Failure Theory	81 – 82
• Effective Stress Principles (Terzaghi's Concept)	82 – 91
• Solved Examples	91 – 95
• Assignment	96 – 98
• Answer Keys & Explanations	99 – 100
#8. Surface Investigations	101 – 112
• Introduction	101
• Methods of Site Exploration	101
• Boring Methods	101 – 103
• Soil Samples	104 – 107

• Dynamic Cone Penetration Test (DCPT)	108 – 110
• Assignment	111 – 112
• Answer Keys & Explanations	112
#9. Earth Pressure	113 – 130
• Introduction	113
• Types of Earth Pressure	113 – 114
• Rankine's Theory	115 – 120
• Solved Examples	121 – 127
• Assignment	128 – 129
• Answer Keys & Explanations	129 – 130
#10. Stability of Slopes	131 – 141
• Introduction	131
• Types of Slopes	131
• Stability Analysis	131 – 133
• Method of Analysis	133 – 137
• Solved Examples	138 – 139
• Assignment	140
• Answer Keys & Explanations	141
#11. Bearing Capacity	142 – 158
• Types of Foundation	142 – 143
• Definitions	143 – 144
• Types of Bearing Capacity Failures	144 – 145
• Terzaghi's Analysis	145 – 148
• Skempton's Bearing Capacity Theory	148 – 149
• Settlement Criteria of Footings	149 – 150
• Solved Examples	150 – 155
• Assignment	156 – 157
• Answer Keys & Explanations	157 – 158
#12. Pile Foundation	159 – 172
• Introduction	159
• Bearing Capacity of Piles	159 – 165
• Feld's Rule	165 - 167
• Solved Examples	168 – 169

• Assignment	170 – 171
• Answer Keys & Explanations	172
Module Test	173 – 180
• Test Questions	173 – 177
• Answer Keys & Explanations	177 – 180
Reference Books	181

“For it matters not how small the beginning may seem to be. What is once well done, is well done forever”

...Henry David Thoreau

CHAPTER

1

Introduction to Soil Mechanics

Learning Objectives

After reading this chapter, you will know:

1. Three Phase System
2. Origin of Soil
3. Water Content Density and Unit Weight
4. Pyrometer Method

Origin of Soil

Soil is a complex material produced by weathering of solid rock. Weathering is caused by physical agencies and geological cycle followed by transportation, denudation and upheaval.

- Residual soil which remain in place directly over parent rock.
- Transported soil is transported by physical agencies like wind, water etc.
- Water Transported soil are called alluvial, marine or lacustrine.
- Lacustrine soil find their origin in lakes.
- Alluvial soil in flowing water and marine soil in seas.
- Air blown soil are called Aeolian.
- Loess is windblown silt or salty clay.
- Accumulation of decaying and chemically deposited vegetable matter under excessive moisture results in formation of cumulose soils (peat and muck).

Three Phase System

- Soil mass is 3 phase system consisting of solid particles, water and air.
- In dry soil, only soil particles and air voids are present. As shown in figure. Figure (a) shows the element of natural soil and figure (b) shows elements separated into 3 phases.

(a) Element of Natural Soil (b) Element of Separated into Three Phases

Soil as a Three Phase System

Water Content, Density and Unit Weights

(a) **Water Content:** Ratio of weight of water W_w to weight of solids, W_s

$$w = \frac{W_w}{W_d} \times 100$$

(b) **Density of Soil:** Mass of soil per unit volume is called density of soil

- **Bulk Density:** Also known as moist density is total mass M of soil per unit of its total volume.

$$\rho = \frac{M}{V}$$

- **Dry Density (ρ_d):** Mass of solids per unit of total volume (prior to drying) of the soil mass.

$$\rho_d = \frac{M_d}{V}$$

- **Density of Solid (ρ_s):** Mass of soil solids (M_d) per unit volume of solids V_s

$$\rho_s = \frac{M_d}{V_s}$$

- **Saturated Density:** When soil mass is saturated its bulk density is called saturated density (ρ_{sat})

- **Submerged Density:** Submerged mass of solids (M_d)_{sub} per unit of total volume.

$$\rho' = \frac{(M_d)_{sub}}{V}$$

$$\rho' = \rho_{sat} - \rho_w$$

Unit Weight of Soil Mass

- **Bulk Unit Weight (γ):** Total weight W of a soil mass per unit of its total volume V

$$\gamma = \frac{W}{V}$$

- **Dry Unit Weight:** Weight of solids per unit of its total volume of soil mass

$$\gamma_d = \frac{W_d}{V}$$

- **Unit Weight of Solids:** weight of soil solids is weight of soil solids W_d per unit volume of solids

$$\gamma_s = \frac{W_d}{W_s}$$

- **Saturated Unit Weight (γ_{sat}):** When the soil mass is saturated, its bulk unit weight is called saturated unit weight.

- **Submerged Unit Weight (γ'):** Submerged unit weight of soil solids (W_d)_{sub} per unit of total volume (V) of soil mass.

$$\gamma' = \frac{(W_d)_{sub}}{V}$$

Specific Gravity:

Specific gravity G is defined as the ratio of the weight of a given volume of soil solids at a given temperature to the weight of an equal volume of distilled water at same temperature.

$$G = \frac{\gamma_s}{\gamma_w}$$

The apparent specific gravity G_m denotes mass of soil to equal mass of water

$$G_m = \frac{\gamma}{\gamma_w}$$

Voids Ratio, Porosity and Degree of Saturation

Voids Ratio: Voids ratio e of a given soil sample is the ratio of the volume of voids to the volume of soil solids in given soil mass.

$$\text{Thus } e = \frac{V_v}{V_s}$$

Void ratios of fine grained soils are generally higher than those of coarse grained soils in general $e > 0$

Porosity: The porosity n of a given soil sample is the ratio of the volume of voids to the total volume of the given soil mass.

$$n = \frac{V_v}{V}$$

Relation between e and n

$$n = \frac{e}{(1 + e)}$$

$$e = \frac{n}{1 - n}$$

Degree of Saturation:

Volume of water to volume of voids is called degree of saturation

$$S = \frac{V_w}{V_v}$$

For perfectly dry sample, $S = 0$ and for perfectly saturated sample, $S = 1$.

Percentage of Air Voids:

Ratio of volume of air voids to the total volume of soil mass and is expressed as percentage

$$n_a = \frac{V_a}{V} \times 100$$

Air Content:

Air content a_c is defined as the ratio of volume of air voids to the volume of voids

$$a_c = \frac{V_a}{V_v}$$

$$V_a = V_v - V_w$$

$$a_c = 1 - S$$

Density Index and Relative Compaction:

$$I_D = \frac{e_{\max} - e}{e_{\max} - e_{\min}}$$

The term density Index is applicable only for cohesionless soil.

Relative Compaction: Relative compaction is defined as

$$R_c = \frac{\gamma_d}{\gamma_{d,\max}}$$

Where $\gamma_{d,\max}$ is obtained from compaction test.

Fundamental Relationships:

- Relation between e , w , G and S

$$S = \frac{V_w}{V_v} = \frac{e_w}{e}$$

Hence $e_w = e_s$

The term e_w is known as the water voids ratio and other symbols have their usual meaning.

$$e = \frac{e_w}{s}$$

- Relation between e , S and n_a

$$n_a = \frac{V_a}{V}$$

$$V_a = V_v - V_w$$

$$V = V_s + V_v = 1 + e$$

$$\therefore n_a = \frac{e - e_w}{1 + e}, \text{ since } e_w = e_s$$

$$\therefore n_a = \frac{e(1 - s)}{1 + e}$$

- Relation between n_a , n and a_c

$$n_a = n \cdot a_c$$

- Relation between γ_d , G and e (or n)

$$\gamma_d = \frac{G\gamma_w}{1 + e}$$

$$\text{Also } \gamma_d = (1 - n)G\gamma_w$$

- Relation between γ_{sat} , G and e

$$\gamma_{sat} = \frac{\text{total weight of saturated soil}}{\text{Total volume of soil}}$$

$$= \frac{\gamma_s V_s + \gamma_w V_w}{V}$$

$$\gamma_{sat} = \frac{(G + e)\gamma_w}{1 + e}$$

- Relation between γ , G , e and S

$$\gamma = \frac{(G + e)\gamma_w}{1 + e}$$

for γ_{sat} ,

$$\gamma_{sat} = \frac{(G + R)\gamma_w}{1 + e}$$

for γ submerged

$$\gamma_{sub} = \frac{(G - 1)\gamma_w}{1 + e}$$

- Relation between γ' , γ_d and n

$$\gamma' = \gamma_d - (1 - n)\gamma_w$$

- Relation between γ_d , G , w and n_a

$$\gamma_d = \frac{(1 - n_a)\gamma_w}{w + \frac{1}{G}}$$
